

Online questionnaire: What are your needs for a new software used for the quantitative assessment of undiscovered mineral resources?

Mineral Resource Assessment Platform (MAP) is a new EIT Raw Materials Upscaling project that will enhance and upgrade the methodology and software used for the quantitative assessment of undiscovered mineral resources. The MAP project team has compiled an online questionnaire in order to get feedback from relevant stakeholders.

The MAP software will integrate mineral prospectivity modelling tools into the three-part assessment method to produce quantitative probabilistic estimates of the amount of undiscovered resources in a given area. The results will be reported in multiple formats, including maps, data tables and text explanations. Further details on the MAP software are available on the project web site: <http://www.map-eitrawmaterials.eu/about-the-project/#tab-id-4>.

The software and assessment results will be relevant for all stakeholders interested and involved in land use planning, mineral resource management in general and mineral resource assessment. This includes spatial planners, exploration companies, mining companies, local, regional and national governments, environmental organizations, geological surveys, consultancy companies, universities and research organizations.

The MAP project team aims to get feedback from relevant stakeholders about how they do quantitative mineral resource assessments today, what kinds of results they find useful, and what future requirements they see for the methodology and software tools used and for the results produced.

Please fill in the questionnaire at <https://www.lyyti.fi/questions/9d7a4f9323> and feel free to share the link in your social media. Your feedback will allow us to develop a software platform for the present and the future!
